Electrochemical processes span a range of technologies

Ammonia electrolysis

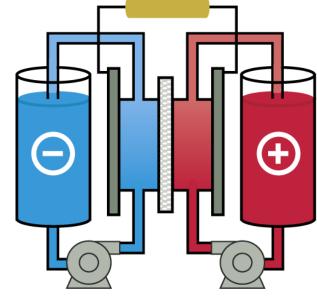

Electrochemical sensors

Ramanujam, Neyhouse, et al., J. Chem. Eng. 2021.

Energy storage

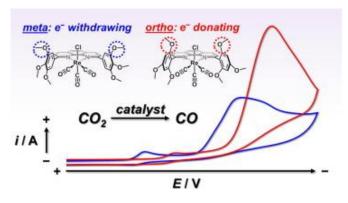

Neyhouse et al., J. Electrochem. Soc. 2021.

Neyhouse et al., ACS Appl. Energy Mat. 2021.

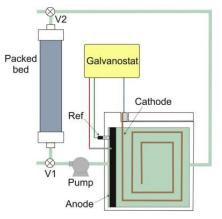

Neyhouse & Brushett, Ency. of Energy Storage 2022.

Carbon dioxide conversion

Neyhouse & White, Inorg. Chim. Acta. 2018.

Materials recycling

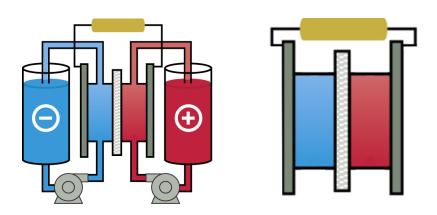

Diaz et al., J. Clean. Prod. 2016.

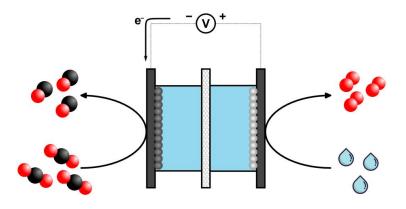

We can generally classify processes as galvanic or electrolytic

Galvanic processes convert chemical energy to electrical energy

Electrolytic processes convert electrical energy to chemical energy

Voltage measures the energy inputs or outputs for electrochemical systems

Current measures the overall conversion in electrochemical reactions

Understanding the relationship between current and voltage requires a detailed description of (electro)chemical processes

Chemical / electrochemical reactions

Cathode (reduction) $A + ne^- \rightarrow B$

Anode (oxidation) $C \rightarrow D + ne^{-}$

Side reactions $B + ne^- \rightarrow S$

Energy / power balance (voltage losses) $V_{cell} = OCV + \eta_{_{K}}(I) + \eta_{_{\Omega}}(I) + \eta_{_{M}}(I)$

Ohmic

losses

Transport

losses

Kinetic

losses

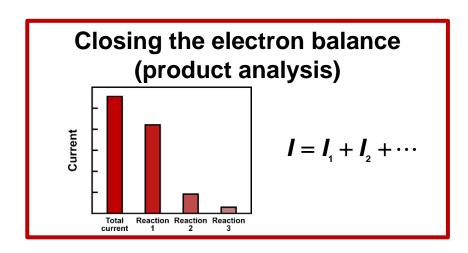

Minimum

energy

Electrochemical thermodynamics and kinetics

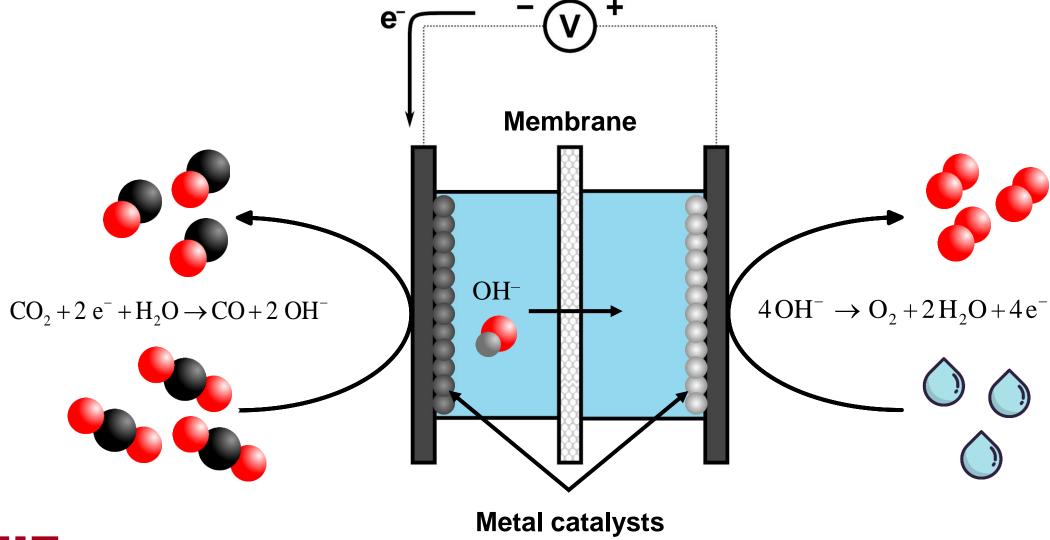

$$A + ne^- \rightarrow B$$
 $E^{0,c} = \cdots$ $k^{0,a} = \cdots$

$$C \rightarrow D + ne^ E^{0,a} = \cdots$$
 $k^{0,c} = \cdots$

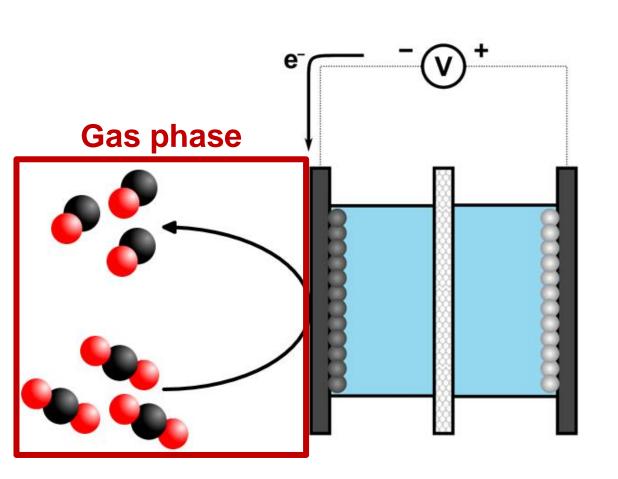

A case study in CO₂ electrolysis

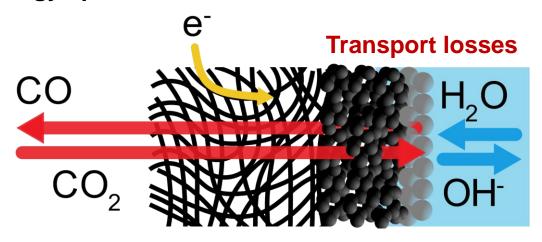

Characterizing 3-phase electrochemical systems

Energy / power balance

Chemical / electrochemical processes

Target $CO_2 + 2 e^- + H_2O \rightarrow CO + 2 OH^-$

Side reactions

$$CO_2 + 8 e^- + 6 H_2O \rightarrow CH_4 + 8 OH^-$$

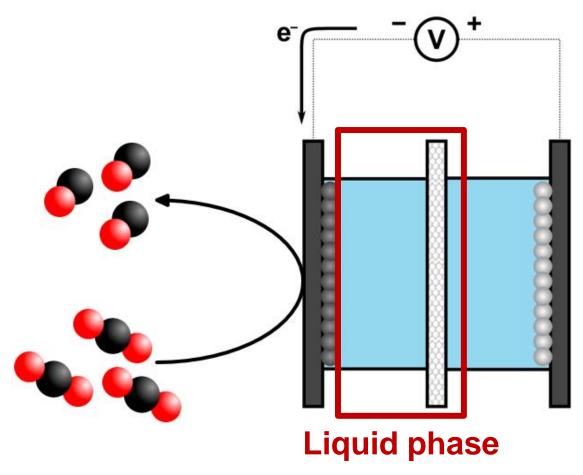

Undesired reactions

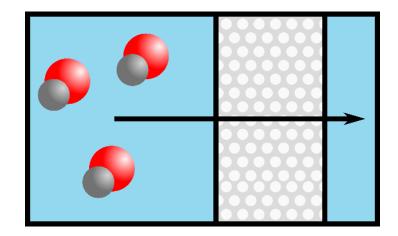

Characterizing 3-phase electrochemical systems

Energy / power balance

Ohmic losses

$$\eta_{\Omega} = IR$$

$$R = R_{\text{\tiny elec}} + R_{\text{\tiny mem}}$$

Chemical / electrochemical processes

Target reaction

$$CO_2 + 2 e^- + H_2O \rightarrow CO + 2 OH^-$$

Side reactions

$$CO_2 + 2 e^- + H_2O \rightarrow HCOO^- + OH^-$$

 $CO_2 + 6 e^- + 5 H_2O \rightarrow CH_3OH + 6 OH^-$

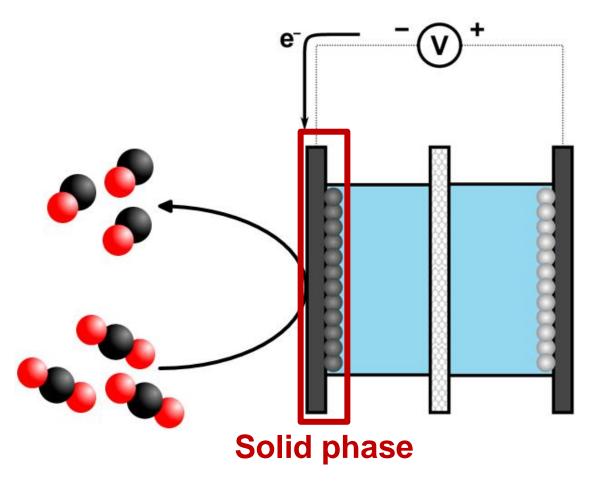

Undesired reactions

 $H_2O + CO_2 \rightarrow H_2CO_3$

Characterizing 3-phase electrochemical systems

Energy / power balance

Kinetic losses

Product selectivity

Ohmic losses

Chemical / electrochemical processes

Target reaction

$$CO_2 + 2 e^- + H_2O \rightarrow CO + 2 OH^-$$

ed

 $2 \operatorname{Na}^{+} + \operatorname{CO}_{3}^{2-} \to \operatorname{Na}_{2}\operatorname{CO}_{3}$

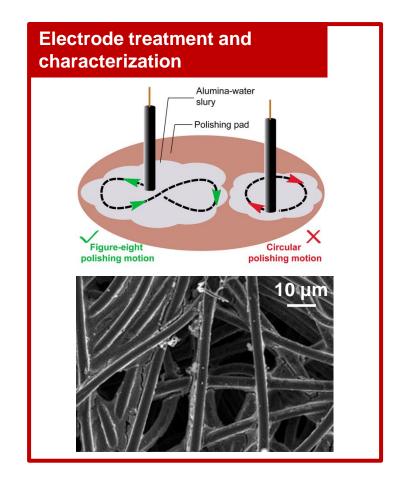

Undesired reactions

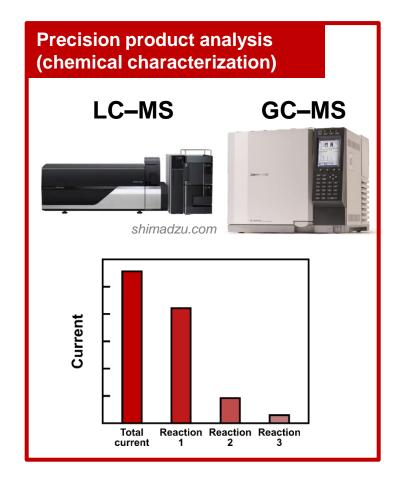

$$M^{n+} + n e^- \rightarrow M$$

Controlling reaction conditions is critical to isolating phenomena and mitigating undesired processes

Understanding the relationship between current and voltage requires a detailed description of (electro)chemical processes

Chemical / electrochemical reactions

Cathode (reduction) $A + ne^- \rightarrow B$

Anode (oxidation) $C \rightarrow D + ne^{-}$

Side reactions $B + ne^- \rightarrow S$

Energy / power balance (voltage losses) $V_{cell} = OCV + \eta_{k}(I) + \eta_{\Omega}(I) + \eta_{m}(I)$

Ohmic

losses

Transport

losses

Kinetic

losses

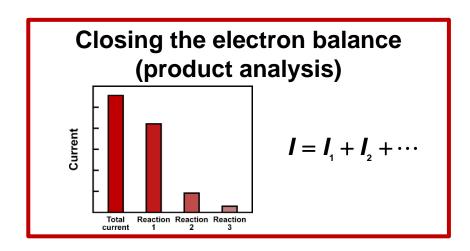

Minimum

energy

Electrochemical thermodynamics and kinetics

$$A + ne^- \rightarrow B$$
 $E^{0,c} = \cdots$ $k^{0,a} = \cdots$

$$C \rightarrow D + ne^ E^{0,a} = \cdots$$
 $k^{0,c} = \cdots$
